CSC 317-04 Group Project 2

Team: Little Nightmares

Name - Github:

Shem Cheng - jeshem

Aung Ko Ko - akko963

Million Kassa - Millionkassabirhanu

Thien Pham - ThienTheCreator

Repo: https://github.com/CSC317-Spring2021/csc317-group-html-storefront-jeshem

For this group project, we had to make a storefront for an online store. Million and Aung did most of the designing for the shop as Thien and Shem joined the team a bit later but once the group got organized and properly connected, all of us did our part to build the storefront. The work mostly did not need assigning; everybody did a little bit on each page to bring everything together.

The team started by making some basic example pages as concepts of the site's layout. From there, a template was created with which we then used to create the other pages in earnest. Without having to worry about a backend for the site, the creation of the site was fairly straight forward, even with the restriction of only using pure HTML. The homepage was probably the easiest to create as it only needed a fake banner, fake advertisement, and the links to the rest of the site. The login/registration and checkout pages were likewise simple to create. We did not have to worry about actually creating/logging into an account nor worry about taking anybody's credit card and charging them for a product. The menu page proved to be the most complicated. Originally, we merely had several images that could be clicked, directed to the checkout page. Aung however figured out a way to turn this page into a menu/cart hybrid that allowed the user to select the amount of food they would like to order before going to the check out.
